## Why focus on tropical forests?

### Tropical forests:

- account for ~34% (42 PgC yr<sup>-1</sup>) of terrestrial GPP.
- account for ~35% (22 PgC year<sup>-1</sup>) of terrestrial NPP.
- contain ~66% (262 PgC) of terrestrial biomass.

The conversion of carbon uptake to biomass depends on carbon allocations and affect directly the carbon cycle and climate

## Questions we will answer today:

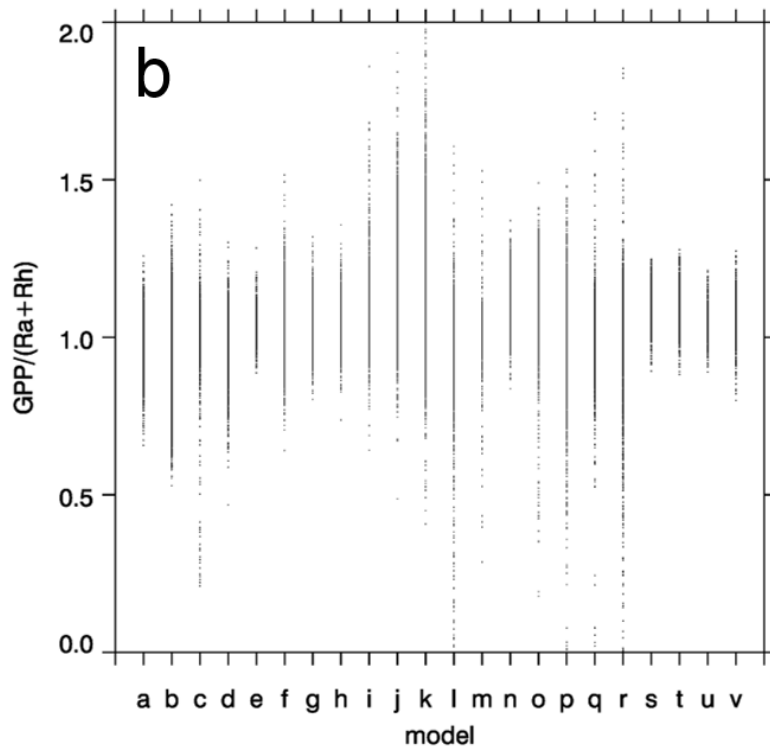

- **Do CMIP5 ESM's reproduce observed allocations (productivity and biomass) in the main tree compartments (leaves, wood, roots)?**
- **Do CMIP5 ESM's represent observed spatial patterns of productivity and biomass?**
- **Which observed-derived Benchmark metric could be used to assess model performance?**
- **Do models reproduce known ecological relationships and forest behaviors?**

# Steady-state conditions?

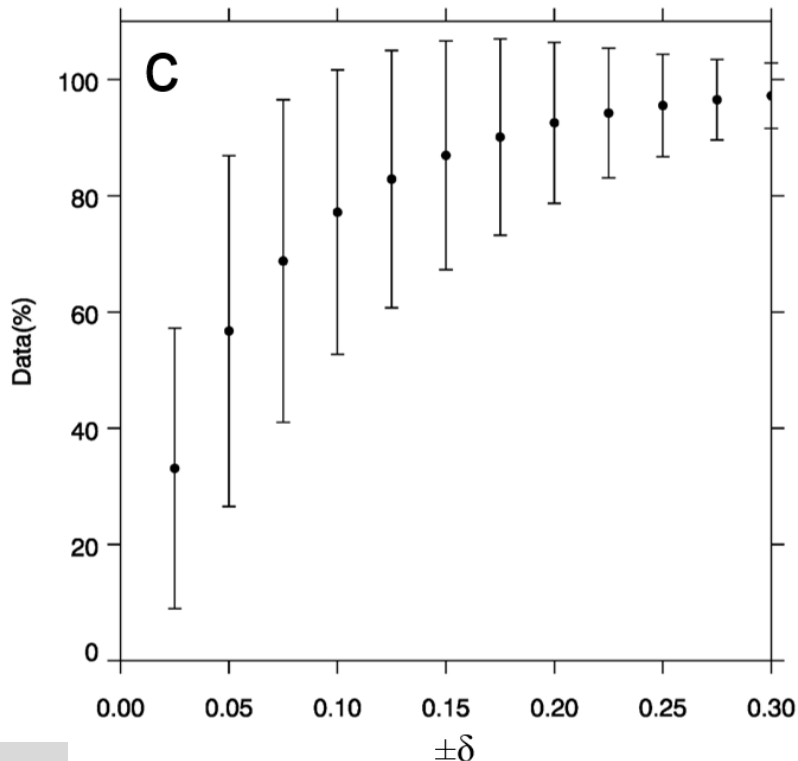

CO<sub>2</sub> inputs (GPP) ~ CO<sub>2</sub> outputs (Ra+Rh)

CMIP5 Historical simulations: yearly data from 1971-2000

$$1 - \delta \leq \frac{GPP}{Ra+Rh} \leq 1 + \delta$$

- a. bcc-csm1-1
- b. bcc-csm1-1-m
- c. BNU-ESM
- d. CanESM2
- e. CCSM4
- f. CESM1-BGC
- g. CESM1-CAM5
- h. CESM1-FASTCHEM
- i. CESM1-WACCM
- j. GFDL-ESM2G
- k. GFDL-ESM2M
- l. HadGEM2-CC
- m. HadGEM2-ES
- n. IPSL-CM5A-LR
- o. IPSL-CM5A-MR
- p. IPSL-CM5B-LR
- q. MIROC-ESM
- r. MIROC-ESM-CHEM
- s. MPI-ESM-LR
- t. MPI-ESM-MR
- u. NorESM1-M
- v. NorESM1-ME

$\delta = \pm 0.1$

# Do models reproduce the observed allocations?

CMIP5 Historical simulations: yearly data from 1971-2000

## a. NPP

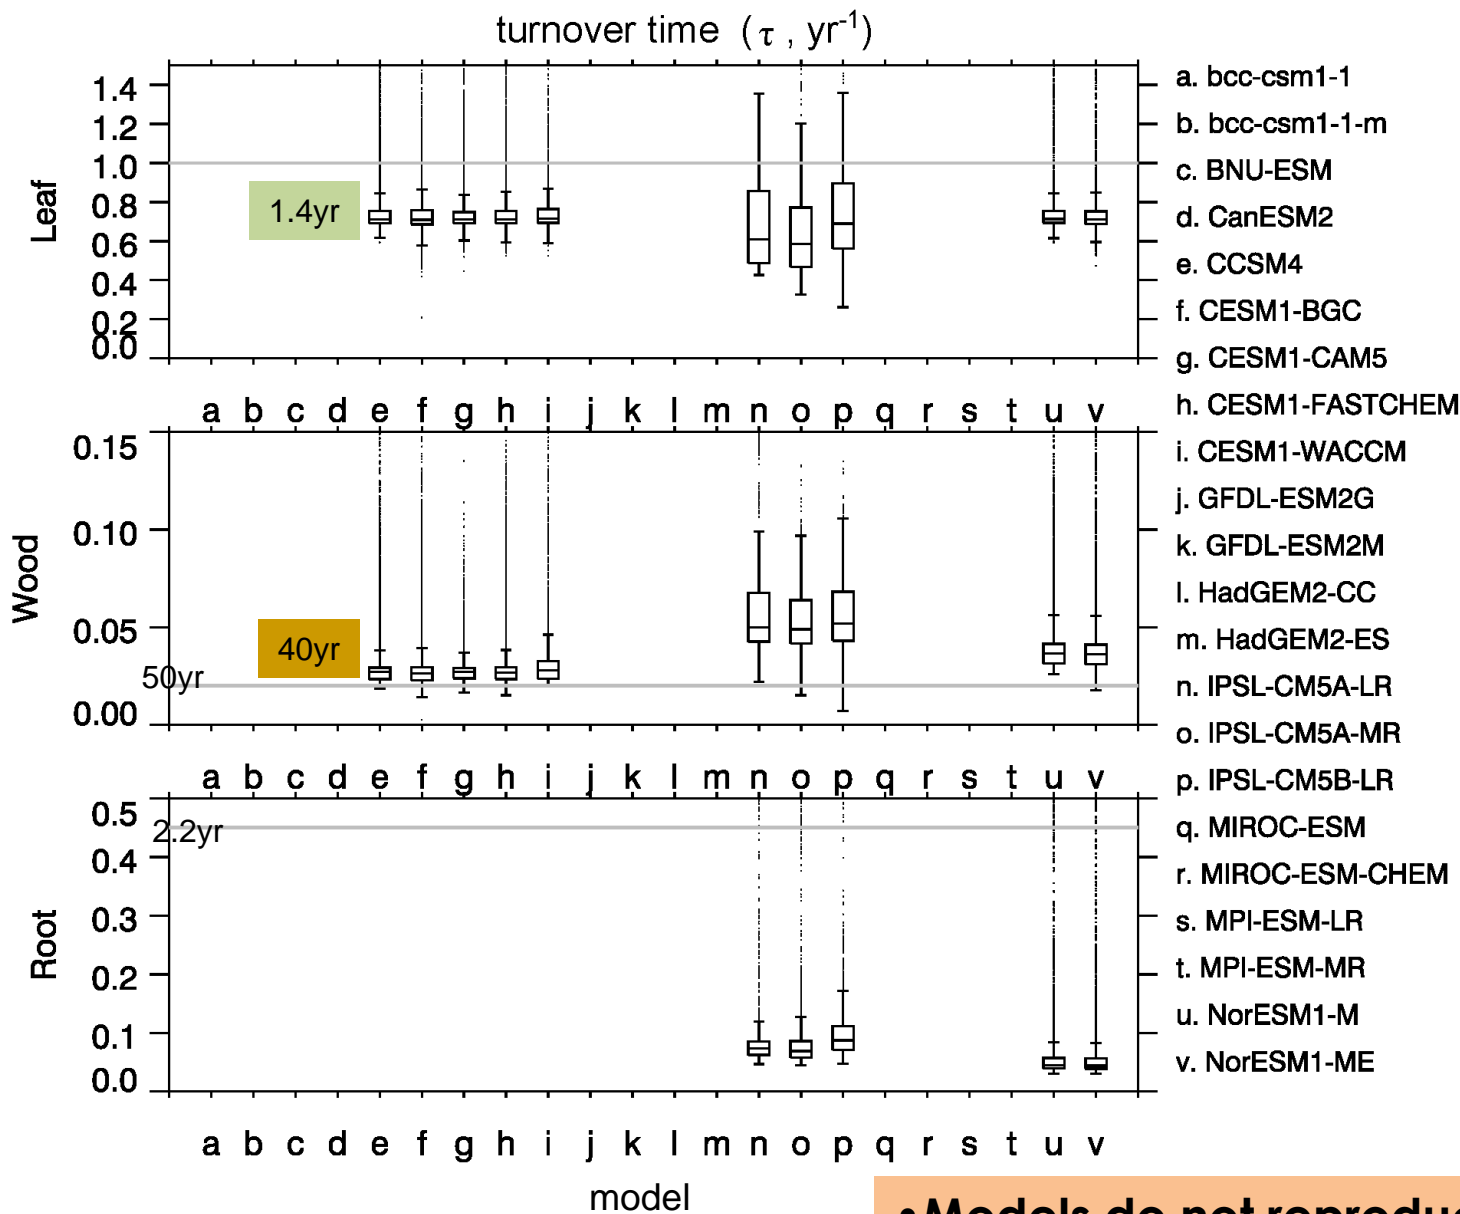

## b. Biomass

**• Models do not reproduce observed allocations.**

# Do models reproduce the observed turnover time?

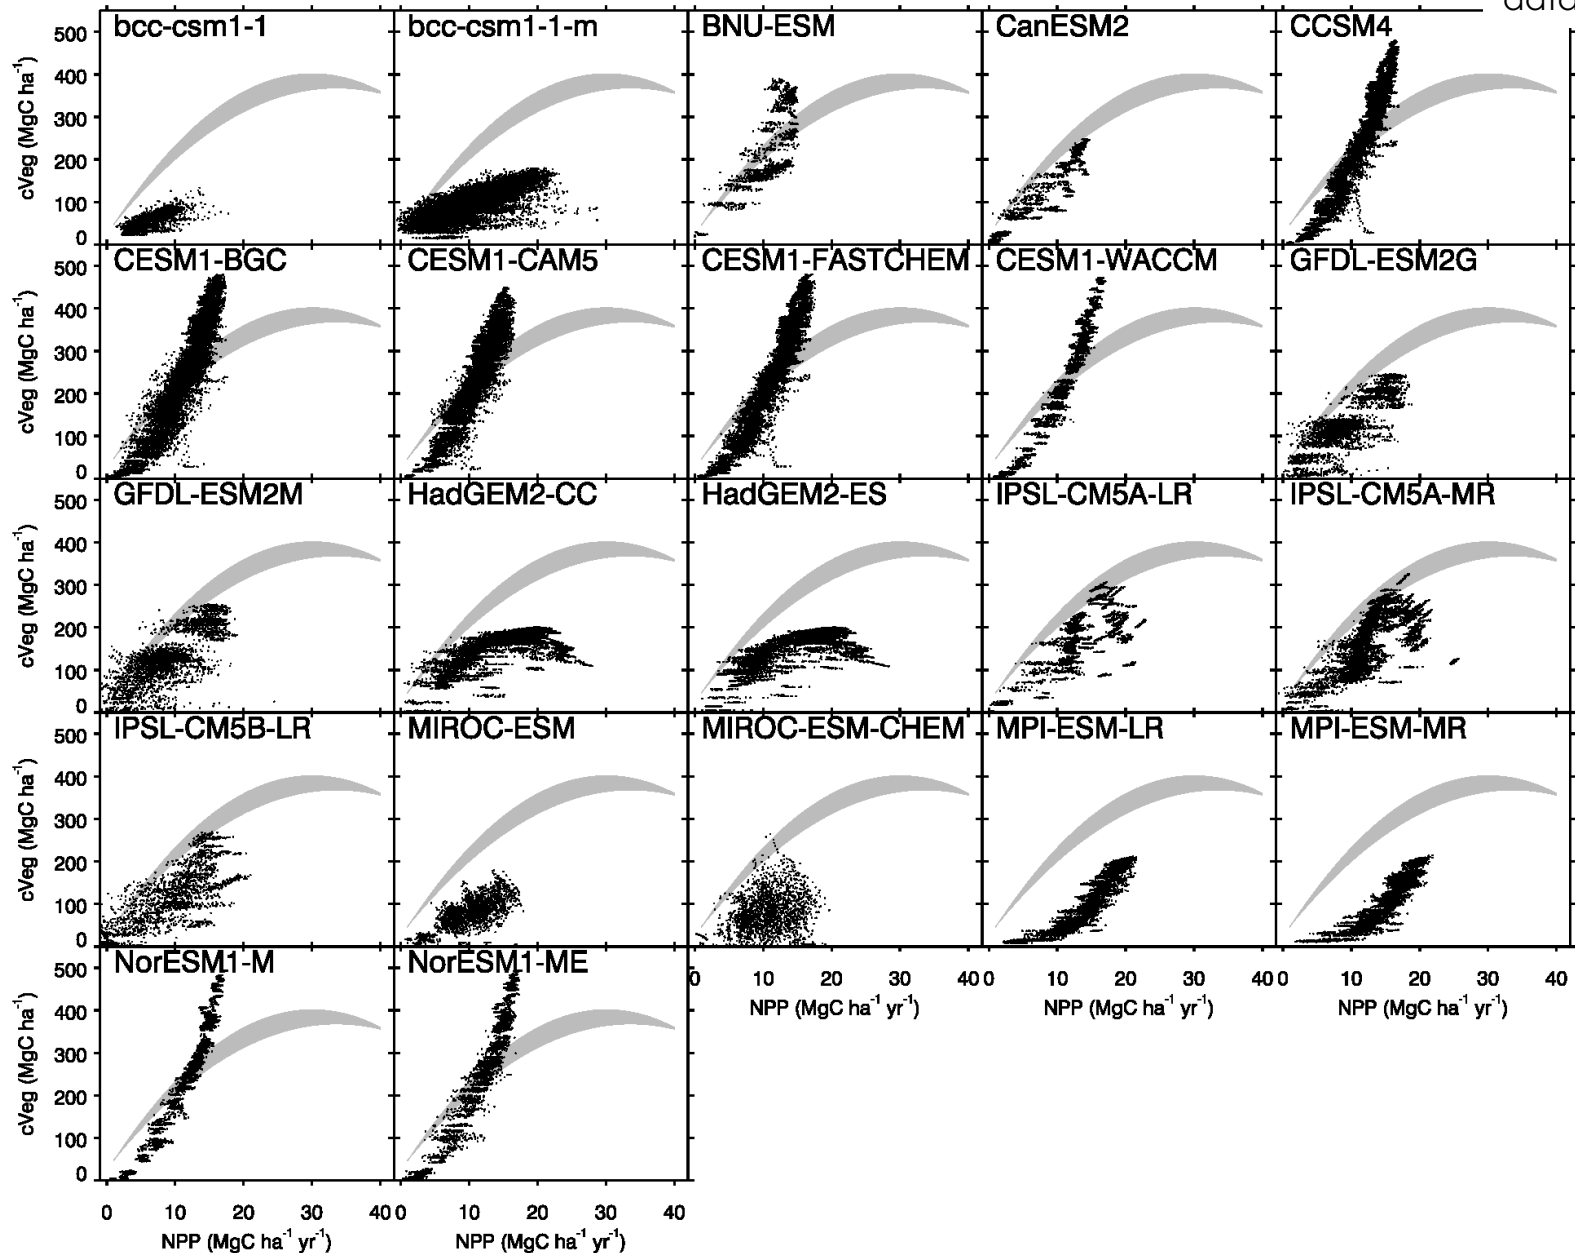

$$\tau_i = \frac{NPP_i}{biomass_i}$$

• Models do not reproduce observed  $\tau$

# Do models reproduce the observed NPP – Biomass relationship?

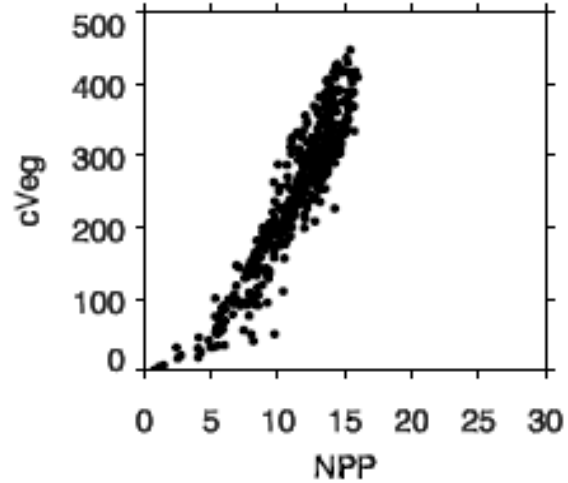

CMIP5 Historical simulations: yearly data from 1971-2000

# Do models reproduce the observed NPP – Biomass relationship?

CMIP5 Historical simulations: mean 1971-2000

## CESM1-CAM5

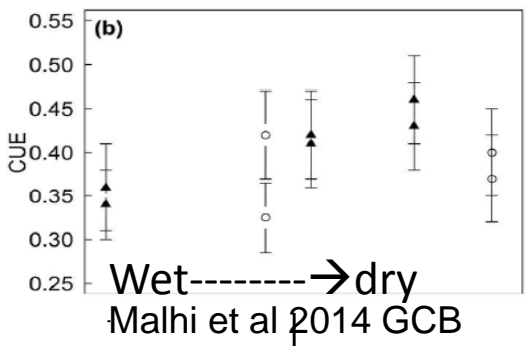

# Which observed derived Benchmark metric can be used?

CMIP5 Historical simulations: yearly data from 1971-2000

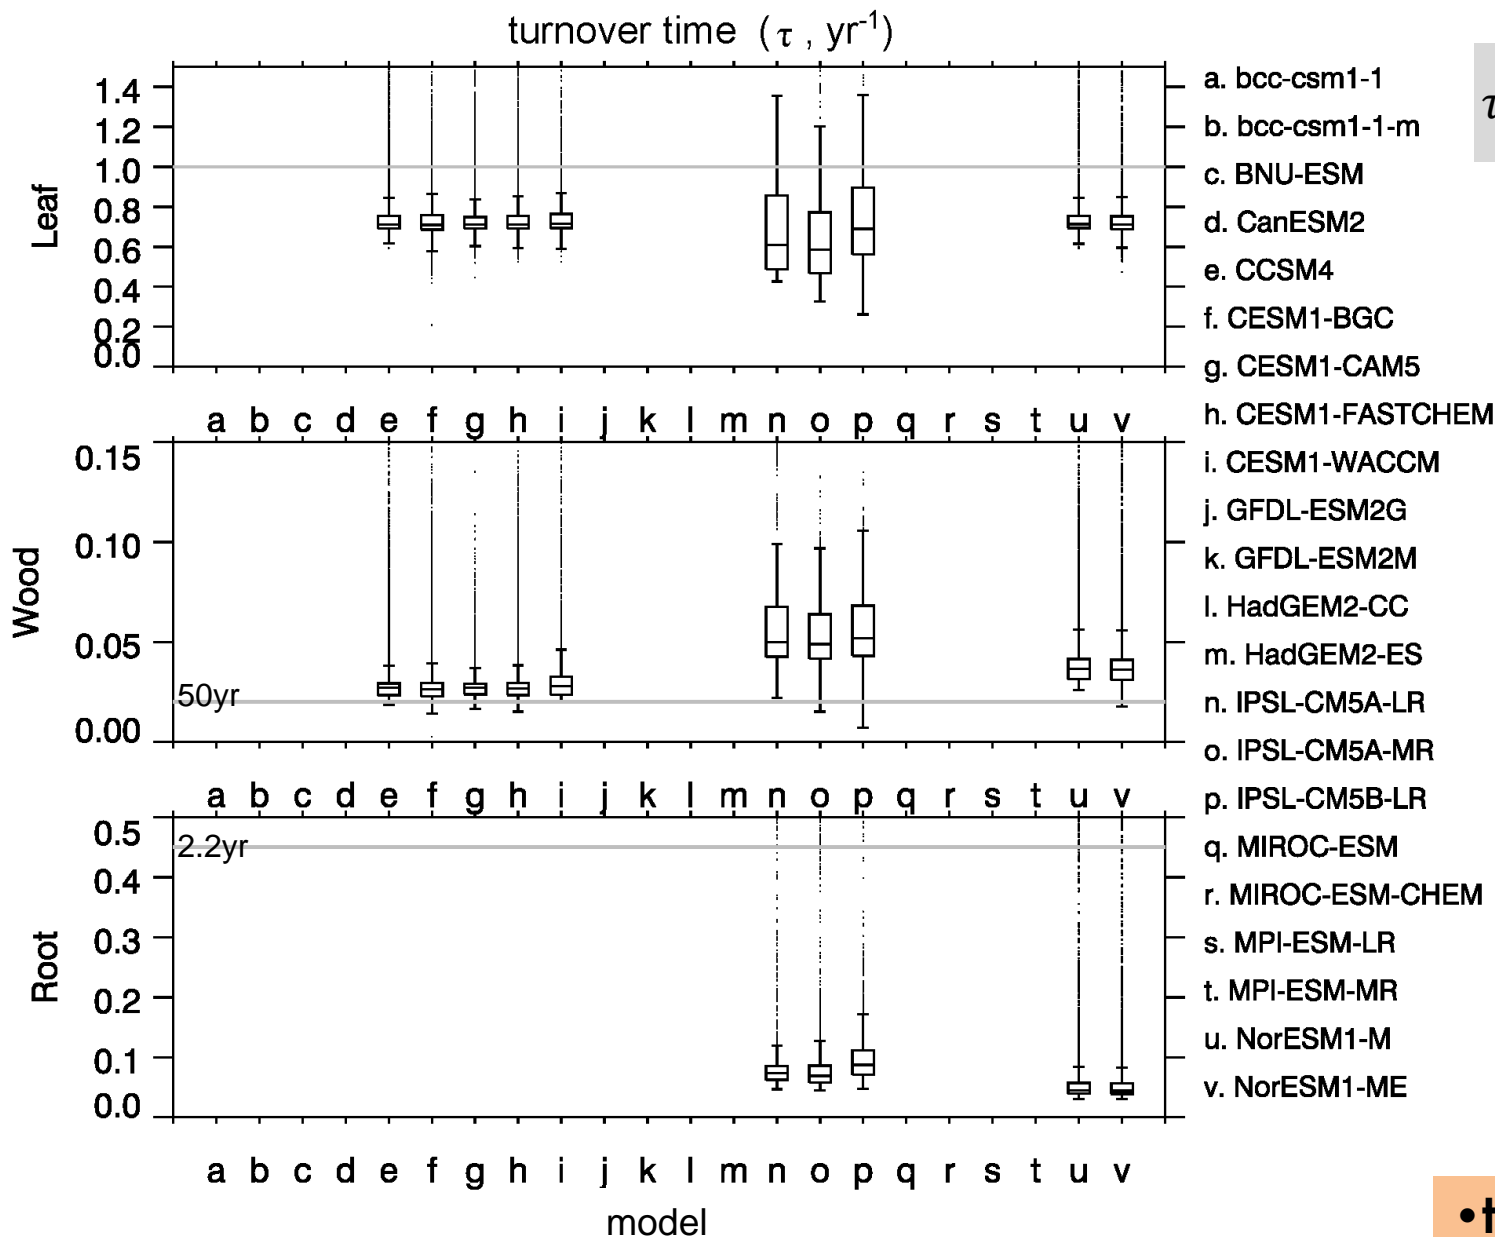

$$CUE(carbon\ use\ efficiency) = \frac{NPP}{GPP}$$

## Carbon use efficiency

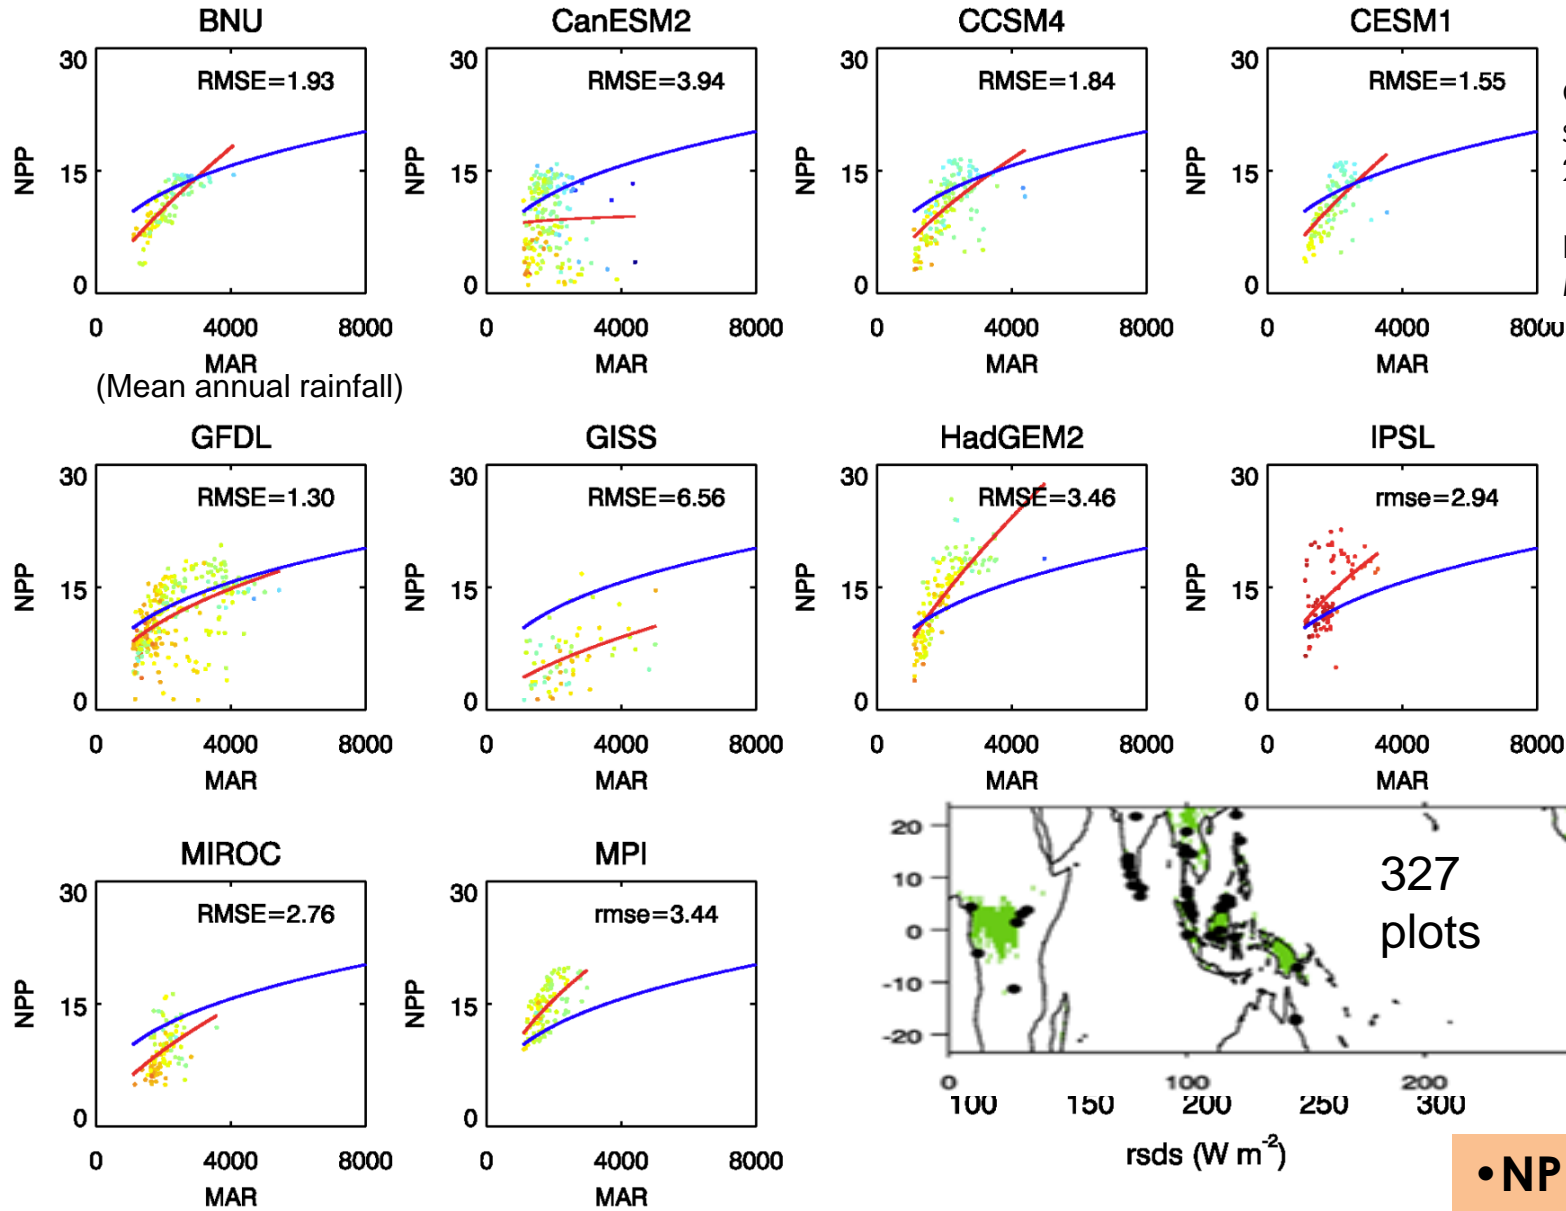

# Which observed-derived Benchmark metric can be used?

$$\tau_i = \frac{NPP_i}{biomass_i}$$

• turnover time

# Which observed derived Benchmark metric can be used?

CMIP5 Historical simulations: 1971-2000  
 NPP:  $\text{MgC ha}^{-1} \text{ yr}^{-1}$   
 MAR:  $\text{mm yr}^{-1}$

**• NPP vs rainfall.**

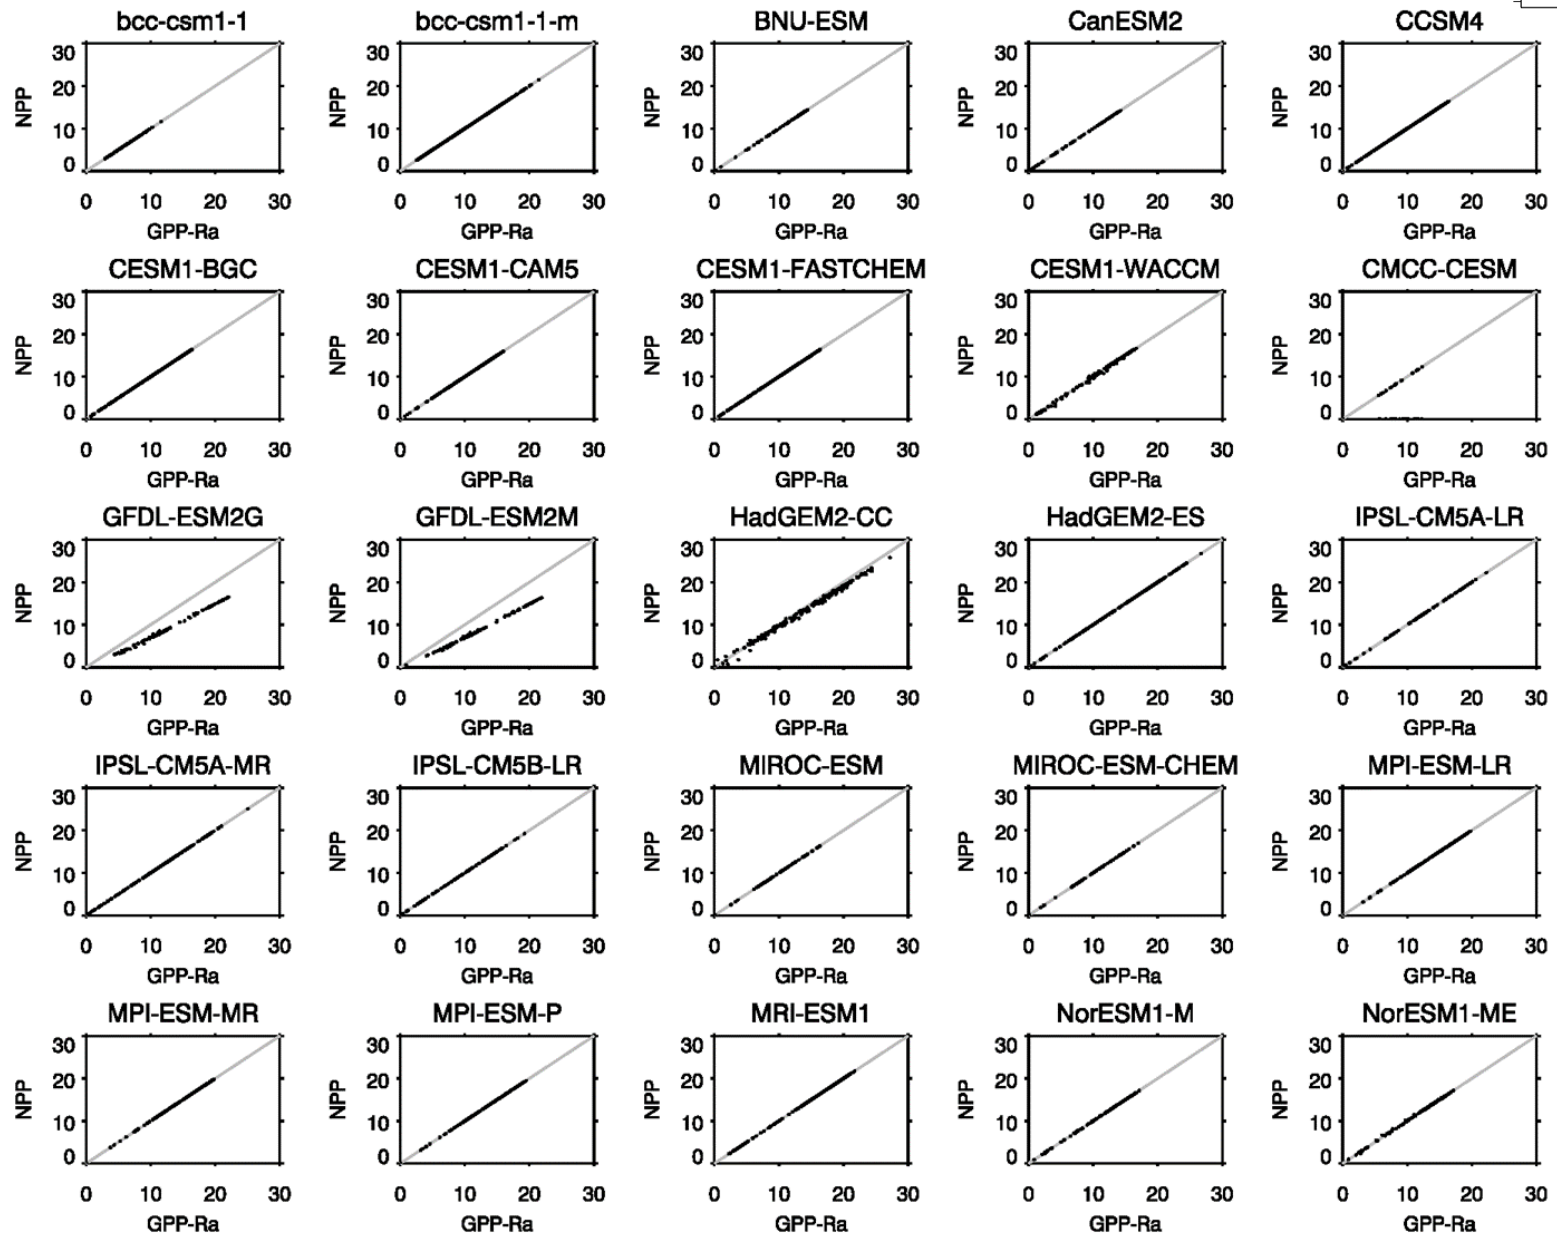

# Do models show basic relationships?

$$NPP = GPP - R_a$$

CMIP5 Historical  
1971-2000

MgC ha<sup>-1</sup> yr<sup>-1</sup>

**Yes, Most of them**

The conversion of carbon uptake to biomass depends on carbon allocations and affect directly the carbon cycle and climate

## Questions we will answer today:

- Do CMIP5 ESM's reproduce observed allocations (productivity and biomass) in the main tree compartments (leaves, wood, roots)?  
**Models do not reproduce observed allocations and turnover time in leaves, wood, and roots.**
- Do CMIP5 ESM's represent observed spatial patterns of productivity and biomass?  
**A decrease in biomass at high values of NPP was not reproduced by models**
- Which observed-derived Benchmark metric could be used to assess model performance?  
**Fraction of GPP to NPP: carbon use efficiency**  
**Allocations: turnover time**  
**Climate and NPP: NPP vs rainfall**
- Do models reproduce basic relationships?  
 **$NPP = GPP - R_a$ : Yes, most of them.**
